

Math 
(alpha release)
Features Document

1. Text Mode	3
1.1. Line Options	3
1.2. Font Options	3
1.3. Suggestion box	3
2. Text Mode Suggestion Box	4
2.1. Inline Math	4
2.2. Math Container	5
2.3. From Latex	6
2.4. Diagram	6
2.5. Tag Reference	6
2.6. Align Layout	7
2.7. Gather Layout	7
2.8. Multiline Layout	7
3. Math Mode Suggestion Box	8
4. Table	10
4.1. Resize	10
4.2. Border	11
4.3. Align	12
4.4. Merge Cells	12
4.5. Context Menu	13
4.6. Features not supported	14
5. Matrix, Array, Cases, Aligned, Gathered, Align, Gather	14
5.1. Matrix	14
5.2. Cases	15
5.3. Gathered	15
5.4. Aligned	16
5.5. Array	16
5.6. Gather	17
5.7. Align	18
6. Brackets	18
6.1. Default brackets	18
6.2. Force Normal Brackets	20
6.3. Manually adjust brackets height	21
7. Undo/Redo/Copy/Paste/Cut	21
8. Shortcuts	22

9. Drawing Area	23
9.1. Tool bar	24
9.2. Text:	24
9.2.1. Display Text in Drawing Area	24
9.2.2. Border	25
9.2.3. Connected Arrow	25
9.2.4. Commutative Diagram	26
9.3. Line	27
9.3.1. Straight Line	27
9.3.2. Curved Line	27
9.4. Arrow	28
9.5. Shape	28
9.5.1. Circle	28
9.5.2. Ellipse	29
9.5.3. Segment of Ellipse (Arc)	29
9.5.4. Rectangle	30
9.5.5. Square	31
9.5.6. Polygon	31
9.5.7. Regular polygon	31
9.5.8. Polycurve	32
9.6. Axis	32
9.6.1. Wave	33
9.6.2. Quadratic Equation	33
9.6.3. Cubic equation	33
9.6.4. Spring	34
9.6.5. Brace	34
9.6.6. Straight Ruler	34
9.6.7. Curved Ruler	35
9.7. Arrow Head and Other Basic Shapes	35
9.7.1. Aim Circle	35
9.7.2. Cross	35
9.7.3. Single Arrow-Head	36
9.7.4. Double Arrow-Head	36
9.7.5. Arrow-Head Shape	36
9.7.6. Curve-Arrow-Head	37
9.8. Graph/Diagram Examples	37
10. Document	38
10.1. Share	38
10.2. Document Management	39
11. Import from Latex	39
12. Export to Latex	40

13. Picture Box	41
14. Save as Image (Png)	42
15. Printing	42

1. Text Mode

$$E = mc^2 + \sqrt{a^2 + b^2}$$

Default text input is in Text Mode, which only allows to input normal text, (Unicode is supported).

Options available in text mode:

1.1. Line Options

- Click (1) to set text align for selected line with Left, Center, Right
- Icon (2) to add section title for selected line maximum with 3 levels, click on to increase/decrease one level
- Icon (3) for list items with number, and (4) for list item with bullets, both have maximum of 3 levels.
- Use (5) to indent or outdent current lines

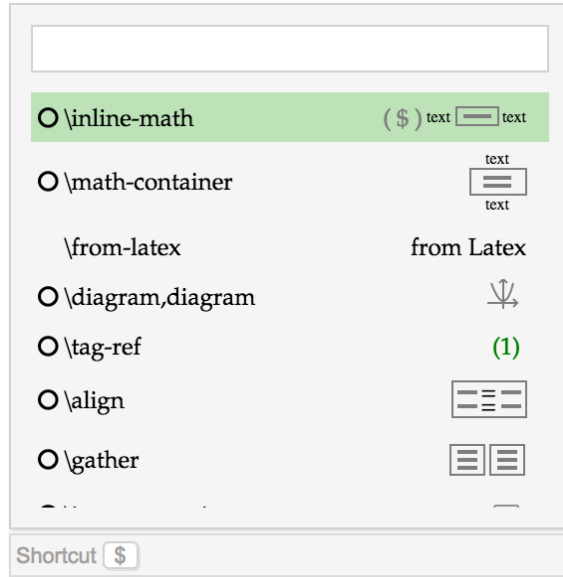

1.2. Font Options

- **B I U S** respectively is for font name, font size, **bold**, *italic*, underline and ~~strike-through~~
- If you change font size of selected text, and there are Math formulas inside your selection, those formulas font size will also be changed.

1.3. Suggestion box

Suggestion box is the core of editor (trigger by "\" on keyboard), the main purpose is to input text and mathematic symbols as quick as possible and not losing the flow of input. (by not moving mouse). Suggestion box will be different from Text Mode and Math Mode

2. Text Mode Suggestion Box

2.1. Inline Math

Name: `\inline-math`

Shortcut: `$`

Insert Math as the same line with normal text, For example: $\vec{F} = m\vec{a}$

Most of symbols are the same in `\inline-math` and `\math-container`, but there are one difference, these symbols below will be display in smaller fonts:

- `\frac`
- `\binom`

These symbols below also use a smaller fonts in `\inline-math`

- `\int`, `\sum`, `\prod`, ... (symbols in the group of Integral and Summation), and default position of limits on the right of Symbol instead of above/below (in `\math-container`).

For example

$$\frac{a}{a} \int_a^a \sum_a^a \prod_a^a \binom{a}{a}$$

If you want to use normal font for those symbols, select those symbols and click on .

For example, now it becomes

$$\frac{a}{a} \int_a^a \sum_a^a \prod_a^a \binom{a}{a}$$

With `\frac`, you also use `\cfrac` to force Fraction in normal font

With `\binom`, you also use `\dbinom` to force Binom in normal font

Note*: if you use Tab inside Math Mode, cursor will jump outside current region. For example I have this equation: $E = mc^2$. If you place your cursor inside that equation, and press Tab, your cursor will be at the end of that equation and go outside Math Mode.

2.2. Math Container

Name: `\math-container`

Insert Math as new line, and align center automatically. For example:

$$\int_b^a xdx + \int_a^a ydy$$

There some symbols which can be in smaller fonts by using `\sum\rightarrow\Sigma`, they are:

- `\frac`, `\binom`, `\int`, `\sum`, `\prod`, ... (symbols in the group of Integral and Summation)

For example:

$$\int_b^a xdx + \int_a^a ydy + \sum_a^a + \frac{a}{a}$$

In this mode, we also can make a tag on the right of `\math-container`, by hovering the mouse on each line, you will see (...), click on that, tag number will be shown (number will be automatically increasing in whole document). For example:

$$E = mc^2 \tag{1}$$

$$\vec{F} = m\vec{a} \tag{2}$$

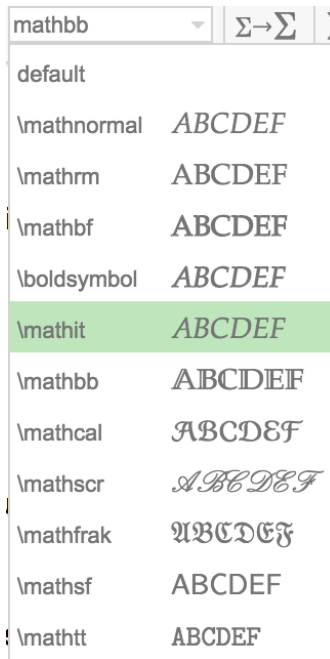

The tag can also be modified by clicking on the tag and select (A) icon, then input Text. For example:

$$E = mc^2 \tag{Einstein's}$$

Tag can be removed by unselect

There are various fonts supported in Math Mode, for example the most common symbols are \mathbb{N} , \mathbb{R} , should be displayed as: \mathbb{N} \mathbb{R} , this can be achieved by selecting `\mathbb` font:

Tip:

- Shortcut for **Bold** is Cmd+B for both Text Mode and Math Mode
- Shortcut for `\mathbb` is Cmd+Shift+B, and `\mathcal` is Cmd+Shift+C

$$\mathcal{L}, \mathbf{a}, n \in (\mathbb{R} \cap \mathbb{N}^*) \langle \text{gen, diff, min} \rangle$$

2.3. From Latex

Name: `\from-latex`

Open Latex Import Dialog, please refer **Import Latex Section** for more information

2.4. Diagram

Name: `\diagram`

Insert Drawing region, please refer **Diagram Section** for more information

2.5. Tag Reference

Name: `\tag-ref`

$$v = \frac{s}{t} \quad (\text{Tag 1})$$

With any formula with the Tag, for example formula above have the tag (Tag 1), this feature allow you to insert tag as a link to refer to that formula.

The advantage of using this one instead of typing (Tag 1) is it allows to click on the (Tag 1) to link to formular, as well as any modifying from the Tag, the other link to that tag will be modify accordingly.

As selecting this featue, you will be asked to select formula as image below:

2.5. Tag Reference

Name: \tag-ref

$v = \frac{s}{t}$ (Tag)

With any formula with the Tag, for example formula above have the tag (Tag), this feature allow you to insert tag as a link to refer to that formula. The advantage of using this one instead of typing (Tag) is it allows to click on the (Tag) to link to formular, as well as any modifying from the Tag, the other link to that tag will be modify accordingly.

2.6. Align Layout

Name: \align

Insert Align layout, please refer **Align Section** for more information

2.7. Gather Layout

Name: \gather

Insert Align layout, please refer **Gather Section** for more information

2.8. Multiline Layout

Name: \multiline

This layout is used when you have a long formula and you want to break it down to multiline.

In this layout, text align is based on:

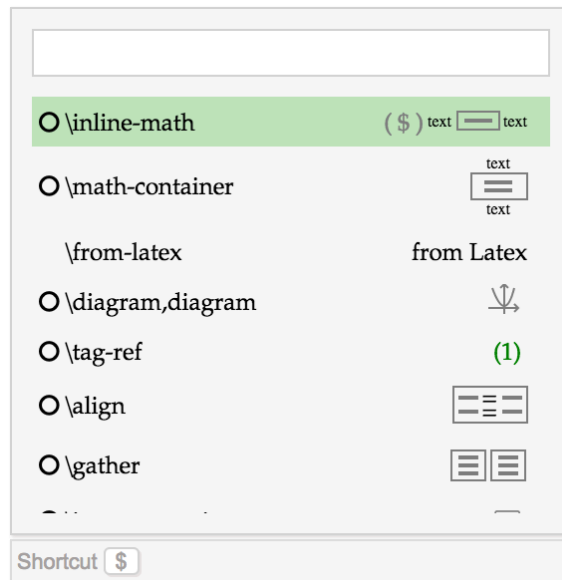

- First line is Left Align
- Last line is Right Align
- Any Line in middle is Center Align

For example:

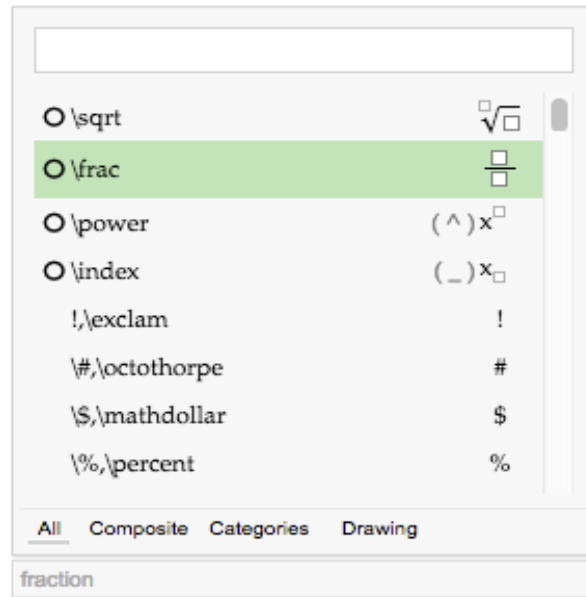

$$\begin{aligned}
 P(Y - X = m | Y > X) &= \sum_k k P(Y - X = m, X = k | Y > X) = \\
 &= \sum_k P(Y - X = m | X = k, Y > X) P(X = k | Y > X) \\
 &= \sum_k P(Y - k = m | Y > k) P(X = k | Y > X).
 \end{aligned}$$

3. Math Mode Suggestion Box

Suggestion box is the core of editor (trigger by "\ " on keyboard), the main purpose is to input text and mathematic symbols as quick as possible and not losing the flow of input. (by not moving mouse). Suggestion box will be different from Text Mode and Math Mode

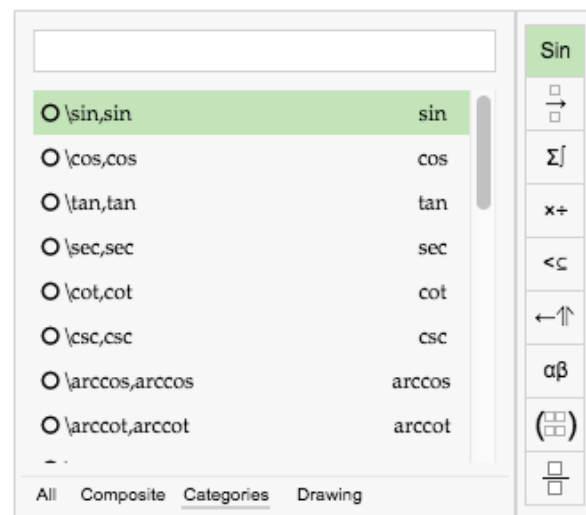

Select math-container to generate a place to input math formula, continue to press \ to insert symbols, suggestion box will automatically turns into:

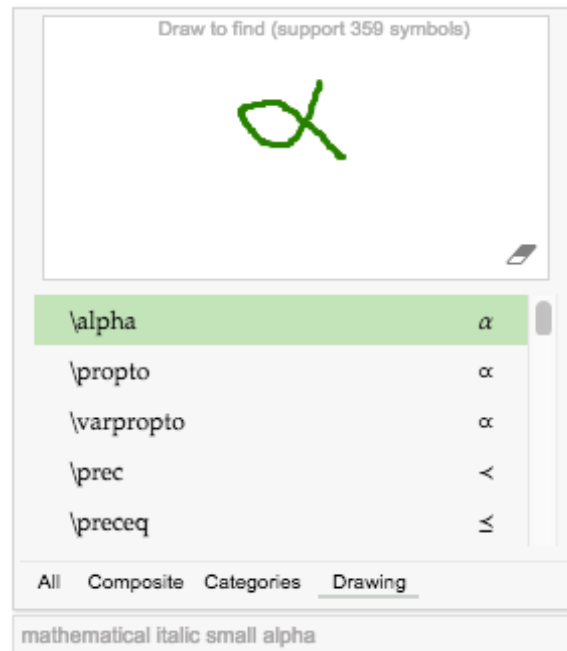

Suggestion box is designed with 4 main options as **[All]**, **[Composite]**, **[Categories]** and **[Drawing]**.

- **[All]** contains all symbols that is provided by suggestion box
- Composite symbols ($\frac{x}{y}$, $\sqrt[y]{x}$...) are included in **[Composite]**
- Composite symbols are also divided into different categories under **[Categories]** like belows

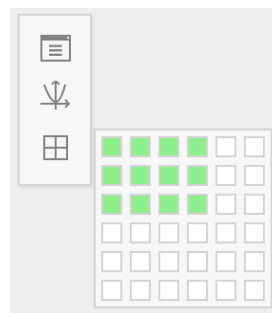

- **[Drawing]** is contains many basic symbols, it is an advanced feature that helps to identify very quickly as simple as drawing it directly using the algorithm. For instance, just draw α to the drawing box like below:

4. Table

Table can be inserted by using Suggestion Box with name `\table`, the default table 3×3 will be inserted.

Another way to insert is using `[icon]`, it allows user to select how many row/column to insert:

4.1. Resize

Rows and columns can be resized by hover on Vertical or Horizontal Border and drag to increase or decrease column width and row height, there are some constraints:

- Minimum Column Width is 10 pixels
- Minimum Row Height is the height of content inside that row

By default, when you insert a new Table, Table Width will be the Width of Document, if Document is resized, Table Width also is resized according to. For example:

But if you resize on the first Vertical Line or the last Vertical Line of Table, Table will manage its own width, and will not follow Document Width. For example:

4.2. Border

You can control border to show or hide in one cell or select multiple cells, click icon on toolbar:

Options:

(1) Add Borders at all sides.

(2) Add Borders at inner sides.

text	text
text	text

(3) Add Borders at outside

text	text
text	text

(4) (5) (6) (7) (8) (9): Adding Borders at Top, Middle, Bottom, Left, Center, Right

(10) Remove all borders

text	text
text	text

Note: For first 9 options (except last one) are accumulated, they will not remove other sides. For example if you select Left Side, it will **not** remove Top/Right/Bottom sides. Usually you need to select last Option to remove all sides first

4.3. Align

Apart from Text Alignment: Left, Center, Right. There are vertical alignments:

Text line 1 Text line 2 Text line 3 Text line 4	This is top align	This is middle align	This is bottom align
--	-------------------	----------------------	----------------------

4.4. Merge Cells

Select multiple cells and right click to select "Merge Cells", selected Cells can not be merged if merged result is not a Cell. For example:

Cell 1, 2, 3,4 are allowed to merge:

1	2	
3	4	

become:

1 2 3 4	

Cell 1, 2 are allowed to merge:

1	2

become:

1 2	

Cell 1, 2, 3 are **not** allowed to merge

1		
2	3	

Merged cell can be unmerged by Right Click and select "Unmerge Cell"

4.5. Context Menu

Select any cell, and right click to show more options to interact with Table :

Select multiple cells, and right click there are only options to remove Rows/Columns and Table:

4.6. Features not supported

- Border Style, Colors
- Background Colors

5. Matrix, Array, Cases, Aligned, Gathered, Align, Gather

5.1. Matrix

Name: \matrix

Default matrix is 2×2 with parenthesis, click on  to show options:

(1) to change to another layout (Array, Cases, ...)

(2) modify number of rows

(3) modify number of columns

(4) select Bracket Type

$$\begin{pmatrix} a_1 & a_3 \\ a_2 & a_4 \end{pmatrix} \quad \begin{bmatrix} a_1 & a_3 \\ a_2 & a_4 \end{bmatrix} \quad \left| \begin{array}{cc} a_1 & a_3 \\ a_2 & a_4 \end{array} \right|$$

Select any cell, and right click to show more options to interact with matrix :

Select multiple cells, and right click there are only options to remove Rows/Columns and Table:

5.2. Cases

Name: \cases

Options as the same with **Matrix**, without Options to select Bracket Type

$$\begin{cases} a_1 & \text{if } k > 0 \\ a_2 & \text{if } k < 0 \end{cases} a f a s d f$$

5.3. Gathered

Name: \gathered

This layout is used when you want to represent formulas in multiple columns, each column will be align center automatically, options as the same with **Matrix**

$$\begin{array}{cc} a + b = c & f = x + y \\ a_1 & b_1 \\ a_2 & b_2 \end{array}$$

*Note: there is **Gather** in Text Mode, which is the same feature, but the space between columns will be bigger

5.4. Aligned

Name: \aligned

This layout is used when you want to represent equations look like this:

$$\begin{aligned} 3(a + b) + b - a &= 3a + 3b + b \\ &= 3a + 4b - a \\ &= 2a + 4b \end{aligned}$$

Or something like this

$$\begin{aligned} a &= x + y & b &= c - d \\ &= 2x - x + y & &= -(-c + d) \\ &= x + 2y - y & &= -(d - c) \end{aligned}$$

Options as the same with **Matrix**

*Note: there is **Aligned** in Text Mode, which is the same feature, but the space between columns will be bigger

5.5. Array

Name: \array

This layout is like "Table" which allow you to have borders and adjust text alignment for each column, Options:

- By clicking on , you will be in "Border Management Mode", click on any side of Row or Column to show or hide the border, then click outside to exit out this Mode:

fx	a_1	\nearrow	b_2
	d_2	\swarrow	d_1

You can have border as below

fx	a_1	\nearrow	b_2
	d_2	\swarrow	d_1

- With  you are able to adjust Text Alignment on Column which your cursor is currently on, you may have somethings like this:

Left Align	Center Align	Right Align
fx	fx	fx

5.6. Gather

Name: `\gather`

*Note: Insert from Text Mode

This layout is the same with `\gathered` layout, but the spaces between columns will be separate equally, for example 2 columns:

$$\begin{array}{cc}
 a + b = c & f = x + y \\
 a_1 & b_1 \\
 a_2 & b_2
 \end{array}$$

Or 3 columns

$$\begin{array}{ccc}
 a + b = c & (3) & f = x + y & (4) & y = 2x + 5y & (5) \\
 a_1 & & b_1 & & c_1 & \\
 a_2 & & b_2 & & c_2 &
 \end{array}$$

Tag can be inserted on the right from each column on every row as example above.

5.7. Align

Name: \align

*Note: Insert from Text Mode

This layout is the same with \aligned layout, but the spaces between columns will be separate equally, for example 2 columns:

$$\begin{aligned} 3(a + b) + b - a &= 3a + 3b + b \\ &= 3a + 4b - a \\ &= 2a + 4b \end{aligned}$$

Or something like this with 4 columns

$$\begin{aligned} a = x + y & & (6) & & = c - d & & (7) \\ & = 2x - x + y & & & = -(-c + d) \\ & = x + 2y - y & & & = -(d - c) \end{aligned}$$

Tag can be inserted on the right from each column-pair on every row as example above.

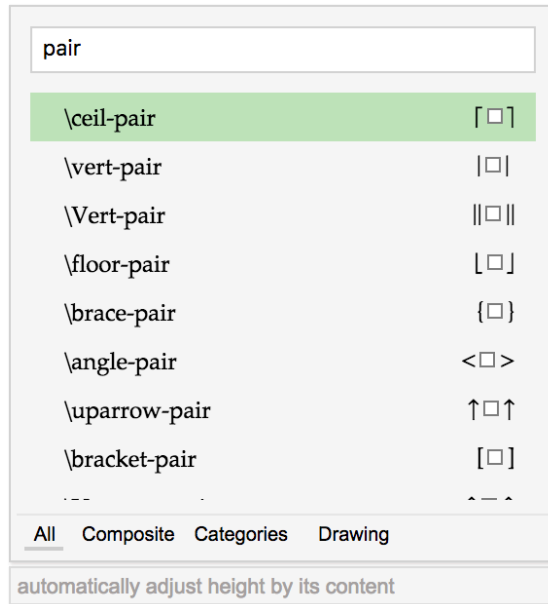

6. Brackets

6.1. Default brackets

By default, brackets height will be adjust automatically if it found paired "open-closed" brackets, for example:

$$\left\{ \frac{a}{b} \right\} \left[\frac{a}{b} \right] \left(\frac{a}{b} \right)$$

For other delimiters likes: $\left| \frac{a}{b} \right| \left\| \frac{a}{b} \right\| \left\langle \frac{a}{b} \right\rangle$, in order to have heigh adjusted automatically by its content, you need to insert via Suggestion box, type "pair", you will see a list of pairs you can insert:

In some cases, you don't need a pair of brackets, but only one side and still want to have bracket height adjust automatically by its content, we can use an special one called "empty bracket". There are 2 kinds of them with the names: "\left." and "\right." (note "dot" at the end).

For example, lets say you want to input somethings like this:

$$\frac{a}{b} \left| a + b \right|^2$$

If you click on formula above, you will see and "gray bar" on the left of $\frac{a}{b}$, which is "empty bracket" with name "\left." in Suggestion Box, this "empty bracket" allows Mathcha to specify which is the content for the height of the "|" (name: "\left|") to be adjust automatically.

More examples:

$$\left\{ \frac{a}{a} \quad \frac{H_2O}{H_2} \right\} \left\| \frac{\sqrt{a^2 + b^2}}{c^2} \right\} d^2$$

These symbols with height adjust automatically () [] {} and :

<code>\left[</code>	[<code>\left\langle</code>	<	<code>\left\downarrow</code>	↓
<code>\left(</code>	(<code>\left\lceil</code>	⌈	<code>\left\Downarrow</code>	⇓
<code>\left\{</code>	{	<code>\left\lfloor</code>	⌋	<code>\left\updownarrow</code>	↕
<code>\left </code>		<code>\left\uparrow</code>	↑	<code>\left\Updownarrow</code>	↕
<code>\left\Vert</code>		<code>\left\Uparrow</code>	⇑	<code>\left.</code>	

<code>\right]</code>]	<code>\right\rangle</code>	>	<code>\right\downarrow</code>	↓
<code>\right)</code>)	<code>\right\rceil</code>	⌋	<code>\right\Downarrow</code>	⇓
<code>\right\}</code>	}	<code>\right\rfloor</code>	⌋	<code>\right\updownarrow</code>	↕
<code>\right </code>		<code>\right\uparrow</code>	↑	<code>\right\Updownarrow</code>	↕
<code>\right\Vert</code>		<code>\right\Uparrow</code>	⇑	<code>\right.</code>	

6.2. Force Normal Brackets

Brackets can be used as normal character with normal height, for example:

$$\left(\frac{a}{a}\right) \left[\frac{a}{a}\right] \left\{\frac{a}{a}\right\}$$

Search in Suggestion Box as the names in table:

<code>\paren</code>	(<code>\bracket</code>	[<code>\brace</code>	{
<code>\rparen</code>)	<code>\rbracket</code>]	<code>\rbrace</code>	}

And other brackets without prefix `\left` or `\right`

6.3. Manually adjust brackets height

Name: `\bigl` or `\bigr`

In some cases you want to force bracket with certain height, you can use `\bigl` or `\bigr` and use setting  to select bracket type and bracket size. For example:

$$\left[a + b \right] \left\| \left\| a - b \right\| \right\|$$

Options:

- (1) Select the Size of brackets
- (2) Select Bracket Types
- (3) Select Open or Closed Bracket

7. Undo/Redo/Copy/Paste/Cut

Those commands used by Shortcut from your Keyboard:

Mac:

- Copy: $\text{⌘} + C$
- Paste: $\text{⌘} + V$
- Cut: $\text{⌘} + X$
- Undo: $\text{⌘} + Z$
- Redo: $\text{⌘} + \uparrow + Z$
- Select All: $\text{⌘} + A$

Windows:

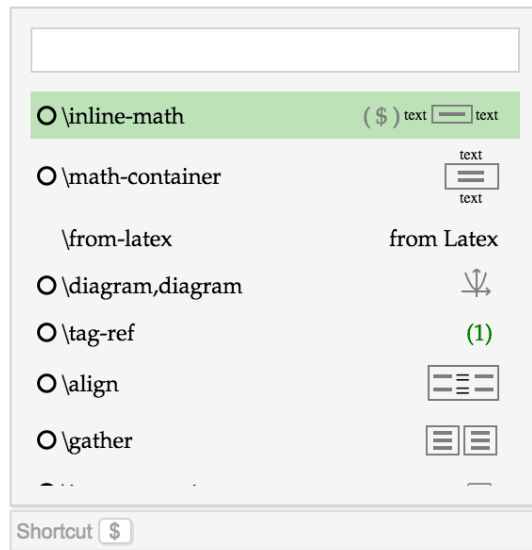

- Copy: $\text{Ctrl} + C$
- Paste: $\text{Ctrl} + V$
- Cut: $\text{Ctrl} + X$
- Undo: $\text{Ctrl} + Z$
- Redo: $\text{Ctrl} + Y$
- Select All: $\text{Ctrl} + A$

Or Click on  For Undo/Redo

8. Shortcuts

There are some shortcuts which is very useful to input for example: \$ to insert \inline-math, ^ and _ to insert \power and \index

Shortcuts can be found in Suggestion Box, if symbol has shortcut, you will see on the left of that symbol and also inside Description (at bottom of Suggestion Box), for example shortcut for \inline-math

Note*: If you are using any input source for your language (for example Vietnamese on Mac), Shortcut may not work properly

There are shortcuts table symbols:

Symbol	Shortcut	Symbol
Power/Superscript	\wedge	x^2
Index/Subscript	$_$	x_2
Right Arrow	$- >$	\rightarrow
Left Arrow	$< -$	\leftarrow

Greater than or equal	\leq	\leq
Less than or equal	\geq	\geq
Implies	\Rightarrow	\Rightarrow
	\pm	\pm
	\mp	\mp
	\ll	\ll
	\lll	\lll
	\gg	\gg
	\ggg	\ggg
	\approx	\approx
	\neq	\neq
	\gtrsim	\gtrsim
	\lesssim	\lesssim
	\nless	\nless
	\ngtr	\ngtr

9. Drawing Area

This feature is very powerful, it helps you not only to draw Diagram/Graph, but also allow you to insert any formula with any position and rotation, in case supported Latex Layout is not enough, you always have this option as a free style layout.

Step 1: To insert a Drawing Area into Math Editor, Click  then a Grid View will come out like below:

Step 2: When the Drawing Area appears, the menu bar will change into:

- Click (1) to turn on/off the grid view of the drawing area
- Drag (2) to the left/right to modify squares's size of the grid
- Click (3) to Formula on grid will be snapped with grid when moving using mouse
- Click (4) to turn on/off the grid only on editing
- Click (5) to save any math's formula in **Math Mode**

Notice: We still **haven't** support **zoom mode for objects** in Drawing Area yet.

9.1. Tool bar

Tool bar is a generalization of action bars that provides a lot of options for drawing on Drawing Area. You can find many options of it showed below.

9.2. Text:

9.2.1. Display Text in Drawing Area

Step 1: Click  on tool bar to insert a Text Box into Drawing Area (All texts in Drawing

Area are in **Math Mode**, Text Mode is **not supported** yet), you may see something like this:

Step 2: Click on Text Box's object which has just appeared, menu bar will turn into:

- Click (1), (2), (3) to set/remove Text Box's border, styles of border are included Rectangle, Ellipse and Circle
- Click (4) to adjust border-width (multiple border sizes included thin, medium, thick...)
- Click (5) to set border-color
- Click (6) to fill in the Text Box's background-color
- Drag (7) to the left/right to rotate a Text Box
- Click (8) to change text-color
- Click (9) to change font-size
- Click (10) to remove Text Box's object from drawing area

9.2.2. Border

Step 1: Click (1) to turn border-style into a Rectangle:

- Drag  to the left/right to round the edges of a text box 's border by adjusting the radius of rounded corner
- Click  to apply frame-stroke-style

Step 2: Click (2) to change border-style into an Ellipse

Step 3: Click (3) to change border-style into a Circle

9.2.3. Connected Arrow

There are various options you can modify for Arrow:

- Click (1), (2), (3) to switch between Straight Line, or Curve Line, or Curve Line with 2 control points
- Click (4), (5) to change Arrow Tail/Head
- There is common scenario that you want to have a hole at middle of arrow, click (6) to achieve that
- You will see 2 more options  which allow you to change position of hole and how big the hole is, click and drag to increase/decrease value as the mouse goes, or double click to change value directly
- Click (7) to change arrow thickness, and (8) to change arrow color
- Click (9) to remove connected arrow's object from drawing area

9.2.4. Commutative Diagram

App supports features to quickly create Commutative Diagram by following steps below:

Step 1:

- Insert Text Box into Drawing Area, you will see something like this:

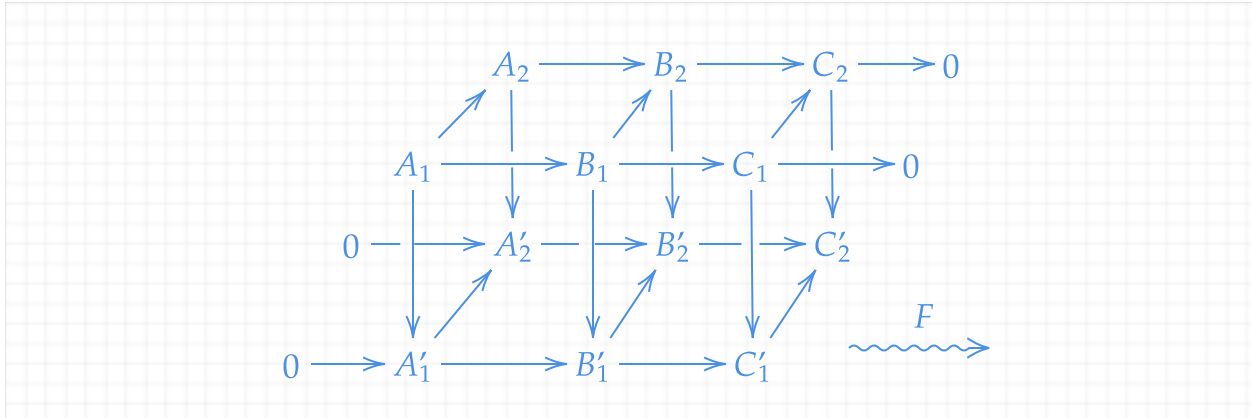

Step 2:

- Insert another Text Box, move this one to the right of the first one
- Select the first Text Box, you will notice 3 arrows around textbox, click on any of those and drag to the position of the second textbox, then you will see an arrow connect 2 textboxes
- Then you can double click on textbox to modify the text inside
- Continue to do same things you will create somethings like below:

Step 3:

- Combine with Connected Arrow's options, you can create Diagram like below:

9.3. Line

You can find many type of lines on toolbar:

9.3.1. Straight Line

There are many options that we can use to modify as below:

- Click (1) and (2) to select styles of head/tail of an line
- Click (3) adjust line-width
- Click (4) to set line-color
- Click (5), (6) to add/remove a point (after add one more point, line will turn into a three-point shape)
- Click (7) to make collisions between two or many shapes appeared
- Click (8) to prevent collision points appeared
- Click (9) to arrange front/back of a line's object (compared to the other objects)
- Click (10) to remove an line from Drawing Area

9.3.2. Curved Line

Click on the curved line, then you can see two points. Each point is connected with one attached point on the tangent of the curve. The point connected with the main point can be adjust to create smooth curves.

- Click  to bend the curve reverselly
- Refer Straight Line's options to other options

9.4. Arrow

Straight Arrow

Straight arrow is inherited the basic options of an arrow which has its head is modified.

Curved Arrow

Curved arrow is inherited the basic options of an curved arrow which has its head is modified.

9.5. Shape

You can find many types of shapes on toolbar:

and

9.5.1. Circle

When click on the circle, four points at four corner will appear allow us to modify size of the circle

Options of a Circle Shape are as below:

- Click (1) to adjust border-width (multiple border sizes included thin, medium, thick...)
- Click (2) to set the circle's border-color
- Click (3) to fill in the circle's background-color
- Click (4) to apply frame-stroke-style
- Drag (5) to the left/right to rotate a circle
- Click (6) to make collisions between two or many shapes appeared
- Click (7) to prevent collision points appeared
- Click (8) to arrange front/back of an line's object (compared to the other objects)
- Click (9) to remove an line from Drawing Area

9.5.2. Ellipse

Options of a Ellipse Shape are much the same as Circle Shape excepted from when modifying the size of circle, width and height can be modify as well, compared to the circle, only radius of a circle can be modified

9.5.3. Segment of Ellipse (Arc)

Arc is used to display an angle in geometry, compared to a circle, when click on the segment, two yellow points will appear in order to protract the length of the segment

Options of a segment is showed as below:

- Click  to show/hide two radius that start from center of the ellipse and end at two head points of the ellipse
- Refer circle's options for other options

Step 1: Insert a line into Drawing Area, click on [icon] to add one more point to a line, adjust a new shape into an angle

Step 2: Insert a segment and rotate until it fits the angle

Step 3: Combine circle shape, line and segment, we can perform a complicated shape like below:

9.5.4. Rectangle

There are lots of option for rectangle:

- Drag  to the left/right to round the edges of a rectangle's border by

adjusting the radius of rounded corner

- Other options can be referred by taking a look at circle's options
- These are shapes that are relatives of rectangle

9.5.5. Square

Refer rectangle's options for square's options.

9.5.6. Polygon

Options for polygon are show as below:

- Click   to add/remove a point (after add one more point, polygon will increase one more side)
- Other options can be referred to circle's options

9.5.7. Regular polygon

Options for Regular polygon:

- Click  to add/remove a side of a regular polygon
- Other options can be referred to circle's options

9.5.8. Polycurve

Click  on tool bar to insert a polycurve

Options for Polycurve:

- Click  to bend the curve reverselly
- Other options can be referred to circle's options

9.6. Axis

Axis and other type of coordinates is showed on tool bar. Click  to inspect more options

Options for Cartesian coordinate system is showed as below:

- Click  to enable separator, when it turns on, you can see some other dependant options:

- Drag to the left/right to increase/ decrease separator's distance
- To show/ hide number, Click
- Click to adjust number-color
- Other options can be referred to circle's options

9.6.1. Wave

Options for Cartesian coordinate system is showed as below:

- Drag to increase/decrease wave length
- Drag to set start of wave's position
- Other options can be referred to circle's options

9.6.2. Quadratic Equation

Options for Cartesian coordinate system is showed as below:

- Other options can be referred to circle's options

9.6.3. Cubic equation

Options for Cartesian coordinate system is showed as below:

- Drag to increase/decrease the height of the curved line compares to horizontal line
- Other options can be referred to circle's options

9.6.4. Spring

Options for Spring coordinate system is showed as below:

- Drag to adjust separator distances
- Other options can be referred to circle's options

9.6.5. Brace

- Other options can be referred to circle's options

9.6.6. Straight Ruler

- Click  to select styles of head/tail of the ruler
- Other options can be referred to circle's options

9.6.7. Curved Ruler

- Click  to select styles of head/tail of a ruler
- Drag  to increase/decrease separator unit distance
- Drag  to increase/decrease separator distance
- Other options can be referred to circle's options

9.7. Arrow Head and Other Basic Shapes

Arrow heads and others are show on tool bar. Click  to see more options.

9.7.1. Aim Circle

- Other options can be referred to circle's option

9.7.2. Cross

- Other options can be referred to circle's options

9.7.3. Single Arrow-Head

Options single arrow-head is showed as below:

- Other options can be referred to circle's options

9.7.4. Double Arrow-Head

Options for double arrow-head is showed as below:

- Click  22 px to increase/decrease separator distance
- Other options can be referred to circle's options

9.7.5. Arrow-Head Shape

Options for arrow-head-shape is show below:

- Drag  to increase/ decrease separator distance
- Other options can be refered to circle's options

9.7.6. Curve-Arrow-Head

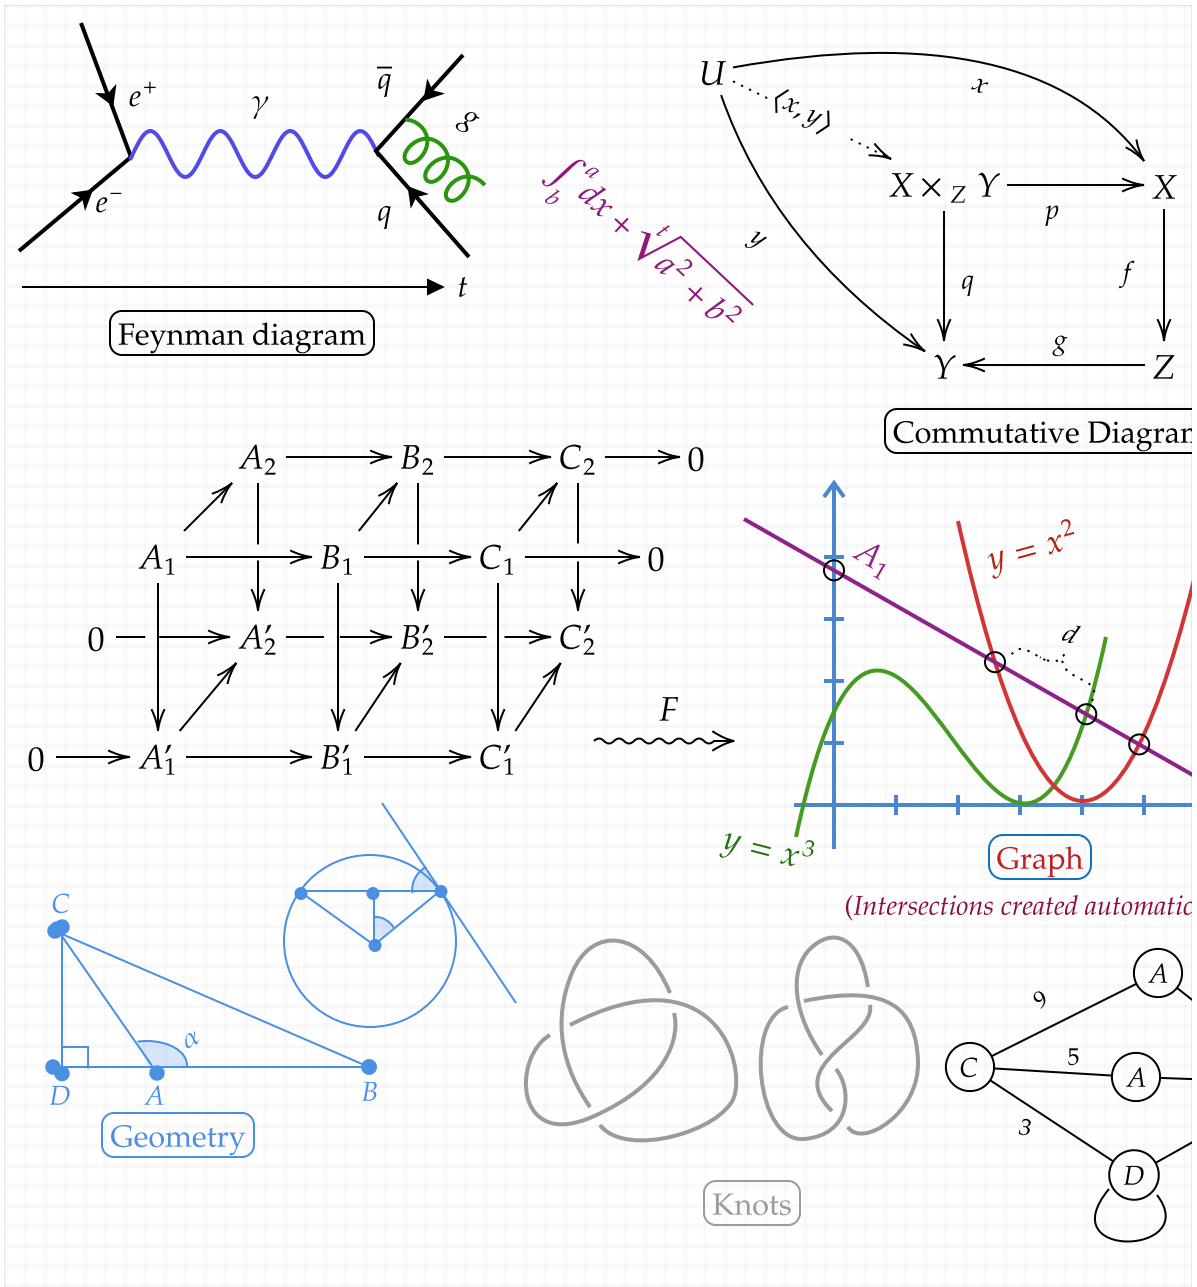

Options for curved arrow head is show below:

- Other options can be refered to circle's options

9.8. Graph/Diagram Examples

10. Document

10.1. Share

Document can be shared by clicking on Share button on Top Bar, a dialog will show up, and you can tick to enable sharing (affect immediately on clicking).

- Note that Share button (and other options on Top Bar) is for current open document (not the one highlighted on left side bar).
- Shared Document seen by other people will be in Read Only Mode, people still can select and copy or duplicate that shared document.
- Shared Document will be marked as Icon  on left side bar.
- Document can be unshared by clicking on Share button again, and uncheck the checkbox.
- Shared link is public, any one with that link can see your shared document.

10.2. Document Management

Double click to open document, **One Click** is only **select/highlight** that Document.

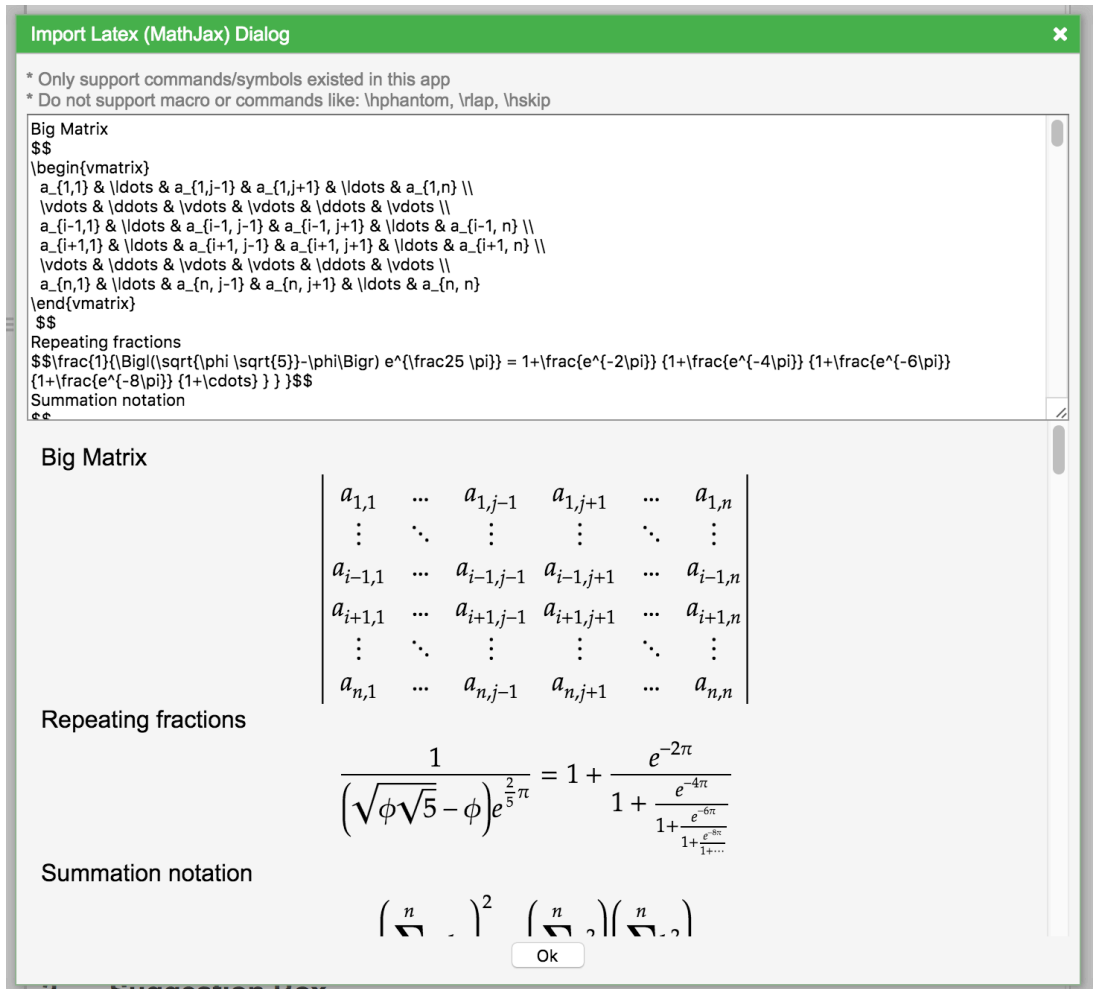

From Left to Right:

- (1) Create New Document
- (2) Duplicate Current selected/highlighted Document (not the open one)
- (3) Rename Current selected/highlighted Document (not the open one)
- (4) Delete Current selected/highlighted Document (not the open one)

Note*: for this release, maximum number of documents allowed to create is **50 documents**

11. Import from Latex

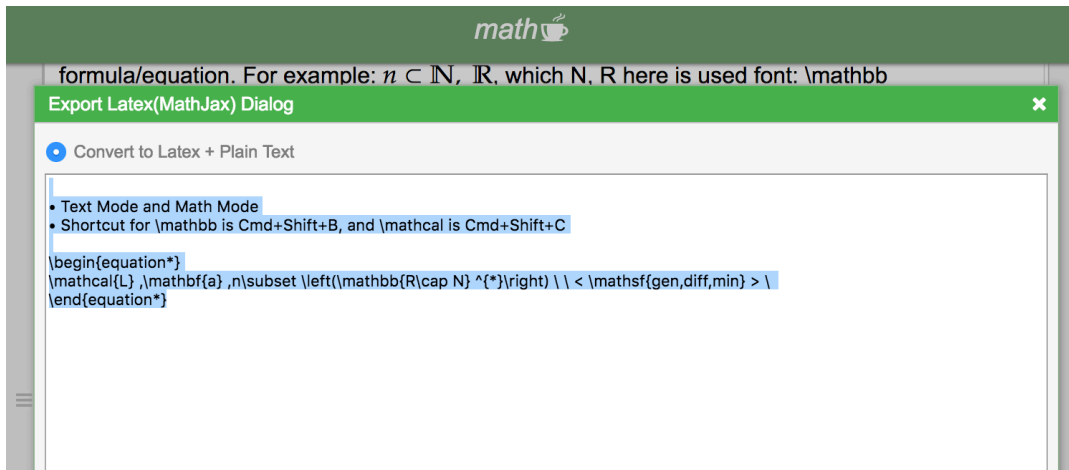

In case you already have a fragment of latex, and you want to import into the App, place cursor in any text in Text Mode, open Suggestion Box → \from-latex or Select Menu → Import from Latex

- Feature import latex can only be inserted at Text Mode (not inside Math Mode)
- Support most of latex symbols using in MathJax, Latex will be parsed in scope of pair $\$ \$$ or $\$ \$ \$ \$$, any text outside will be parsed as normal text.
- It **can not** parse any Latex from Text Mode in this release

12. Export to Latex

- Convert to "Math Mode Latex + Plain Text" is only option supported in this release.
- Select any part of text, and click export icon to export a section
- Or elect Export menu to export whole document or selection
- It **can not** convert to Latex in Text Mode in this release

13. Picture Box

Press `\` to open suggestion box, then select **[image-container]**, the result will appear like below:

On the left corner, Click  to open picture box's options

- Click    to align an image to the left/right/middle
- Click **[Both]** to resize both width and height of an image
- Click **[Width]** to resize only the width side of an image

- Click **[Height]** to resize only the height of an image
- Insert url of an picture to text box which contains a **"Please input an image url"** message
- Click **[Set Image]** to fill an image into picture box

Other type of picture box is **[inline-image]**, Press \ to open suggestion box, then select **[inline-image]**, this function is as same as **[image-container]** but the image is smaller and in the same line of the text.

14. Save as Image (Png)

If you are inside **Math Mode** or **Diagram**, you will able to save to Image of that Math Mode (Diagram) region, for example with formula below:

$$\nabla \cdot \mathbf{D} = \rho$$

$$\nabla \cdot \mathbf{B} = 0$$

$$\nabla \times \mathbf{E} = - \frac{\partial \mathbf{B}}{\partial t}$$

$$\nabla \times \mathbf{H} = \mathbf{J} + \frac{\partial \mathbf{D}}{\partial t}$$

Place cursor inside formula above, and click "Save as Image" button on Toolbar to download Image

This feature will **not** work in Safari browser, because of security restriction.

15. Printing

You can print document by click Menu → Print, or press ⌘+P .

Note: You should not click Print from Browser directly, the reason is Application need to do some preparation steps before printing.

This feature only supports very basic printing, which is convinient to export to PDF, there is no any setting or advanced printing feature yet in this release
